

**Torque Technology has upgraded all button type clutch packs to ceramic buttons.**

Over the past 10 years, truck and engine manufacturers have significantly increased horsepower and torque. The new ceramic button clutch disc performs better in these high torque applications.

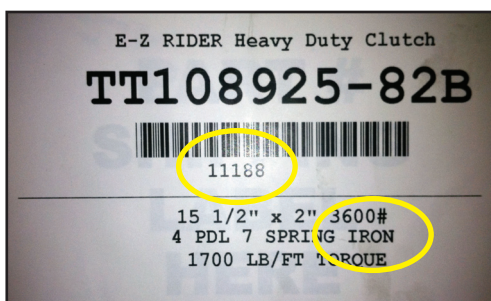

- Torque Technology’s ceramic button provides roughly 10-15% more holding power (torque capacity) than carbotic (iron) buttons. This reduces the possibility of slipping.
- The new ceramic buttons have the same wear characteristics as iron buttons.
- Ceramic button clutch packs are the OEM standard.
- The new ceramic buttons are more eco-friendly because they are lead free.

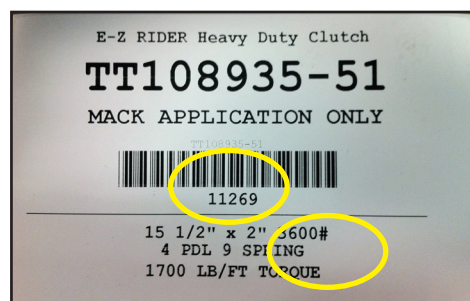

All production as of 9-25-2011 is ceramic and you can determine this two different ways on the label.

1. The Julian date is listed below the bar code, 11262 and higher is ceramic.
2. In the description, the previous packs with iron buttons had that noted on the label. The newer packs with ceramic buttons do not show “iron”.
